Sample Analytical Math Questions with Detailed Solutions

1. Word Problem Involving Optimization

Question:

A farmer wants to build a rectangular fence along a riverbank without fencing on the side adjacent to the river. If the total fencing available is 200 meters, what dimensions should the farmer choose to maximize the area of the field?

Solution:

Step 1: Define Variables

Let:

- x = length of the side perpendicular to the river
- y = length of the side parallel to the river

Since fencing is only needed for three sides (two sides perpendicular and one side opposite the river), the fencing constraint is:

$$2x + y = 200$$

Step 2: Express the Area

Area A :

$$A = x \times y$$

Express y in terms of x :

$$y = 200 - 2x$$

So,

$$A(x) = x(200 - 2x) = 200x - 2x^2$$

Step 3: Find the Maximum Area

Differentiate $A(x)$:

$$A'(x) = 200 - 4x$$

Set derivative to zero to find critical points:

$$200 - 4x = 0 \Rightarrow x = 50$$

Step 4: Verify the Nature of Critical Point

Second derivative:

$$A''(x) = -4$$

Since it's negative, $x=50$ yields a maximum.

Step 5: Find y

$$y = 200 - 2(50) = 200 - 100 = 100$$

Answer:

The farmer should build a fence with sides:

- Perpendicular sides: 50 meters each
- Opposite side (along the river): 100 meters

This configuration maximizes the enclosed area to:

$$A_{\max} = 50 \times 100 = 5000 \text{ square meters}$$

2. Function Analysis and Limits

Question:

Determine the limit:

$$\lim_{x \rightarrow 0} \frac{\sin(3x)}{x}$$

Solution:

Step 1: Recognize Standard Limits

Recall that:

$$\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$$

Step 2: Rewrite the Expression

Express the limit to utilize the standard form:

$$\frac{\sin(3x)}{x} = 3 \times \frac{\sin(3x)}{3x}$$

Step 3: Apply Limit

As $x \rightarrow 0$:

$$\lim_{x \rightarrow 0} \frac{\sin(3x)}{3x} = 1$$

Therefore,

$$\lim_{x \rightarrow 0} \frac{\sin(3x)}{x} = 3 \times 1 = 3$$

Answer:

$$\boxed{3}$$

3. System of Equations and Logical Reasoning

Question:

Solve the system:

[

\begin{cases}

$$2x + y = 10 \quad \backslash$$

$$x - y = 2$$

$\end{cases}$

$\backslash$

Solution:

Step 1: Use Substitution or Elimination

Let's use elimination:

Multiply the second equation by 2:

$$\backslash [2x - 2y = 4 \backslash]$$

Now, subtract this from the first:

$$\backslash [(2x + y) - (2x - 2y) = 10 - 4 \backslash]$$

Simplify:

$$\backslash [2x + y - 2x + 2y = 6 \rightarrow 3y = 6 \rightarrow y = 2 \backslash]$$

Step 2: Find (x)

Plug $(y=2)$ into the second original equation:

$$\backslash [x - 2 = 2 \rightarrow x=4 \backslash]$$

Answer:

$\backslash [$

$\boxed{\quad}$

$$x=4, \quad y=2$$

$\quad]$
