Create functions to compute moments and stresses based on input parameters.

- Implementation in C:

Write modular code with functions like ``calculate_bending_moment()``, ``calculate_stress()``, and ``display_results()``.

- Validation:

Compare results with analytical solutions or experimental data.

Sample C Code Snippet:

```
```c

include

double calculate_bending_moment(double load, double length, double position) {

// Simple uniform load case

return load position (length - position) / length;

}

double calculate_stress(double bendingMoment, double sectionModulus) {

return bendingMoment / sectionModulus;

}

int main() {

double load = 1000; // N/m

double length = 10; // meters

double position = 5; // meters from start

double sectionModulus = 0.005; // m^3

double moment = calculate_bending_moment(load, length, position);

double stress = calculate_stress(moment, sectionModulus);

printf("Stress at position %.2f m: %.2f Pa\n", position, stress);

return 0;

}

```
```
