Common Topics and Sample Problems with Solutions

Algebra and Functions

One of the core areas involves solving equations, manipulating algebraic expressions, and analyzing functions.

Sample Problem:

Given the function $f(x) = 2x^2 - 3x + 4$, find the coordinates of its vertex and determine whether it opens upwards or downwards.

Solution (as per the memorandum):

- The quadratic function is in standard form $(ax^2 + bx + c)$, with $(a=2)$, $(b=-3)$, $(c=4)$.
- Since $(a=2 > 0)$, the parabola opens upwards.
- The x-coordinate of the vertex is given by $(x = -\frac{b}{2a} = -\frac{-3}{2 \times 2} = \frac{3}{4})$.
- Substitute $(x = \frac{3}{4})$ into $(f(x))$:

$\left[$

$$f\left(\frac{3}{4}\right) = 2 \left(\frac{3}{4}\right)^2 - 3 \left(\frac{3}{4}\right) + 4 = 2 \times \frac{9}{16} - \frac{9}{4} + 4 = \frac{18}{16} - \frac{36}{16} + \frac{64}{16} = \frac{18 - 36 + 64}{16} = \frac{46}{16} = \frac{23}{8}$$

$\right]$

- Vertex coordinates: $\left(\frac{3}{4}, \frac{23}{8}\right)$.

Calculus: Differentiation and Applications

Calculus questions often involve finding maximum or minimum points, rates of change, or the area under curves.

Sample Problem:

Find the stationary points of $(g(x) = x^3 - 6x^2 + 9x + 2)$ and classify them as maxima, minima, or points of inflection.

Solution:

- Find $(g'(x))$:

[

$$g'(x) = 3x^2 - 12x + 9$$

]

- Set $(g'(x) = 0)$:

[

$$3x^2 - 12x + 9 = 0 \Rightarrow x^2 - 4x + 3 = 0$$

]

- Solve:

[

$$x^2 - 4x + 3 = 0 \Rightarrow (x - 1)(x - 3) = 0$$

]

- Critical points at $(x=1)$ and $(x=3)$.

- Find $(g''(x))$:

[

$$g''(x) = 6x - 12$$

\]

- Classify:

- At $(x=1)$:

\[

$$g''(1) = 6(1) - 12 = -6$$

- At $(x=3)$:

\[

$$g''(3) = 6(3) - 12 = 6 > 0 \Rightarrow \text{local minimum.}$$

- Find the corresponding (y) -values:

\[

$$g(1) = 1 - 6 + 9 + 2 = 6$$

\]

\[

$$g(3) = 27 - 54 + 27 + 2 = 2$$

\]

- Results:

- Local maximum at $(1,6)$

- Local minimum at $(3,2)$

Trigonometry and Analytical Geometry

Questions often involve solving equations involving angles, identities, or analyzing geometric figures.

Sample Problem:

In triangle ABC, angle $(A=30^\circ)$, side $(a=8)$ units. Find side (b) if $(\sin B = \frac{1}{2})$.

Solution:

- Use Law of Sines:

[

$$\frac{a}{\sin A} = \frac{b}{\sin B}$$

]

- Substitute known values:

[

$$\frac{8}{\sin 30^\circ} = \frac{b}{\sin 30^\circ}$$

]

- Since $(\sin 30^\circ = 0.5)$:

[

$$\frac{8}{0.5} = \frac{b}{0.5} \rightarrow 16 = \frac{b}{0.5} \rightarrow b = 16 \times 0.5 = 8$$

]

Answer: $(b=8)$ units.
