Sample Questions and Answer Key

To reinforce understanding, here are some typical questions with their answers.

Q1. State the law of reflection.

Answer: The law of reflection states that the angle of incidence is equal to the angle of reflection, measured with respect to the normal to the surface.

Q2. What is the critical angle? How is it related to total internal reflection?

Answer: The critical angle is the minimum angle of incidence in a denser medium for which total internal reflection occurs when light tries to pass into a less dense medium. When the angle of incidence exceeds the critical angle, all the light is reflected back into the denser medium.

Q3. Describe the formation of a virtual image by a convex mirror.

Answer: A convex mirror always forms a virtual, erect, and diminished image behind the mirror. The reflected rays appear to diverge from a point behind the mirror, which is where the virtual image is formed.

Q4. What is dispersion? Give an example of where dispersion occurs naturally.

Answer: Dispersion is the splitting of white light into its constituent colors when passing through a prism. A natural example is the formation of a rainbow when sunlight passes through raindrops.

Q5. How does a magnifying glass work?

Answer: A magnifying glass is a convex lens that enlarges the appearance of objects by forming a virtual, erect, and magnified image when the object is placed within the focal length of the lens.

QuestionAnswer What is the principle of refraction in optics? Refraction is the bending of light as it passes from one medium to another with a different optical density, governed by Snell's law which relates the angles and refractive indices of the two media. How does a convex lens form an image? A convex lens converges incoming parallel rays to a focal point, forming real, inverted images when objects are beyond the focal length, and virtual, erect images when objects are within the focal length. What is the difference between reflection and refraction? Reflection is the bouncing back of light from a surface, while refraction is the bending of light as it passes through different media. How does the human eye focus light to form clear images? The eye adjusts its lens shape using the ciliary muscles to focus light precisely onto the retina, allowing for clear images at various distances (a process called accommodation). What is the role of a concave mirror in optics? A concave mirror converges incoming light rays to a focal point, making it useful for applications like telescopes, headlights, and shaving mirrors due to its ability to produce real or virtual images. How does dispersion of light occur in a prism? Dispersion occurs because different wavelengths (colors) of light refract at different angles when passing through a prism, splitting white light into a spectrum of colors. What is the significance of the focal length in lens systems? Focal length determines the convergence or divergence of light rays passing through a lens, affecting the size and position of the image formed; a shorter focal length means a more powerful lens.
