Solution:

- The Punnett square yields: AA, Aa, Aa, aa.
- Total outcomes: 4.
- Favorable outcomes: 2 (Aa).
- Probability: $2/4 = 1/2$ or 50%.

Answer key tip: Always set up a Punnett square and count the outcomes carefully.

2. Probability of Multiple Events

Question: What is the probability that two independent events both occur? For example, flipping a coin twice and getting heads both times.

Solution:

- Probability of heads on one flip: $1/2$.
- For two flips: $(1/2) \times (1/2) = 1/4$.

Answer key tip: Multiply probabilities of independent events to find combined likelihoods.

3. Probability in Population Genetics

Question: If the frequency of a dominant allele (A) in a population is 0.6, what is the probability that a randomly selected individual is homozygous recessive (aa)?

Solution:

- Using Hardy-Weinberg principle: $q = 1 - p = 0.4$.
- Probability of homozygous recessive: $q^2 = 0.4 \times 0.4 = 0.16$ or 16%.

Answer key tip: Understand Hardy-Weinberg equilibrium formulas for accurate calculations.

Advanced Probability Problems in Biology

1. Chi-Square Test for Genetic Data

Question: How do you determine if observed genetic ratios significantly differ from expected ratios?

Solution:

- Calculate expected frequencies based on Mendelian ratios.
- Use the chi-square formula:

$$\chi^2 = \sum \frac{(O - E)^2}{E}$$

$$\chi^2 = \sum \frac{(O - E)^2}{E}$$

$$\chi^2 = \sum \frac{(O - E)^2}{E}$$

where O = observed frequency, E = expected frequency.

- Compare the calculated chi-square value to a critical value from the chi-square table to determine significance.

Answer key tip: Practice with real data sets to develop intuition for statistical significance.

2. Probability of Disease Transmission

Question: In a population, the probability of an individual being infected is 0.2. What is the probability that in a group of 5 individuals, exactly 2 are infected?

Solution:

- Use binomial probability:

$$P(k) = \binom{n}{k} p^k (1-p)^{n-k}$$

$$P(k) = \binom{n}{k} p^k (1-p)^{n-k}$$

$$P(k) = \binom{n}{k} p^k (1-p)^{n-k}$$

where n=5, k=2, p=0.2.

- Calculate:

$$P(2) = \binom{5}{2} (0.2)^2 (0.8)^3$$

$$P(2) = \binom{5}{2} (0.2)^2 (0.8)^3$$

\]

\[

$$P(2) = 10 \times 0.04 \times 0.512 = 10 \times 0.02048 = 0.2048$$

\]

Importance of Probability in IB Math

- Develops critical thinking and decision-making skills
- Enhances understanding of data and statistics
- Prepares students for higher-level mathematics and real-world applications
- Integral for topics like combinatorics, random variables, and statistical inference

Core Concepts of IB Math Probability

Basic Probability Principles

- Sample Space (S): The set of all possible outcomes of a random experiment.
- Event (E): A subset of the sample space, representing outcomes of interest.
- Probability of an Event (P(E)): The ratio of favorable outcomes to total outcomes, assuming equally likely outcomes.

Formula:

$$P(E) = \frac{\text{Number of favorable outcomes}}{\text{Total number of outcomes}}$$

Note: For non-uniform probability distributions, different methods are employed.

Types of Probability

- Theoretical Probability: Based on known possible outcomes.
- Experimental Probability: Derived from conducting experiments or simulations.

Fundamental Rules of Probability

Addition Rule

Used when calculating the probability that at least one of two events occurs.

- For mutually exclusive events (events that cannot happen simultaneously):

$$P(A \cup B) = P(A) + P(B)$$

- For non-mutually exclusive events:

$$P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

Multiplication Rule

Used to find the probability that both events occur.

- For independent events (the outcome of one does not affect the other):

$$P(A \cap B) = P(A) \times P(B)$$

- For dependent events:

$$P(A \cap B) = P(A) \times P(B|A)$$

where $P(B|A)$ is the probability of B given A has occurred.

Conditional Probability and Independence

Conditional Probability

The probability of event B occurring given that event A has already occurred:

$$P(B|A) = \frac{P(A \cap B)}{P(A)}$$

This concept is crucial when analyzing dependent events.

Independence of Events

Two events A and B are independent if:

$$P(A \cap B) = P(A) \times P(B)$$

If this condition is not met, the events are dependent.

Discrete Random Variables and Probability Distributions

Discrete Random Variables

Variables that take specific values, often counts or integers, with associated probabilities.

Probability Distributions

- Probability Mass Function (PMF): Assigns probabilities to each possible value.
- Expected Value (Mean): The average outcome of a random variable.

$$E(X) = \sum x \times P(X = x)$$

- Variance: Measures the spread of the distribution.

$$\text{Var}(X) = E[(X - E(X))^2]$$

Common Probability Distributions in IB Math

Binomial Distribution

Models the number of successes in a fixed number of independent trials with the same probability of success.

Conditions:

- Fixed number of trials (n)
- Two possible outcomes (success/failure)
- Independence between trials
- Constant probability of success (p)

Probability Mass Function:

$$P(X = k) = \binom{n}{k} p^k (1-p)^{n-k}$$

where (k) is the number of successes.

Geometric Distribution

Models the number of trials until the first success.

Probability:

$$P(X = k) = (1 - p)^{k-1} p$$

where $(k \geq 1)$.

Poisson Distribution

Models the number of events occurring in a fixed interval or space when events occur independently at a constant average rate (λ) .

Probability:

$$P(X = k) = \frac{\lambda^k e^{-\lambda}}{k!}$$

- Calculate:

$$P(X=6) = 210 \times 0.0467 \times 0.0256 \approx 0.253$$
