QuestionAnswer What is the definition of velocity in physics? Velocity is a vector quantity that refers to the rate at which an object changes its position with respect to time, including both magnitude and direction. What is Newton's First Law of Motion? Newton's First Law states that an object at rest remains at rest, and an object in motion continues in motion with the same speed and in the same direction unless acted upon by an external force. How is acceleration different from velocity? Velocity is the rate of change of displacement with respect to time, while acceleration is the rate of change of velocity with respect to time. What are the units of force in physics? The SI unit of force is the Newton (N), where 1 Newton is equal to $1 \text{ kg}\cdot\text{m}/\text{s}^2$. State the Law of Conservation of Energy. The Law of Conservation of Energy states that energy cannot be created or destroyed; it can only be transformed from one form to another, but the total energy remains constant. What is the formula for calculating speed? Speed is calculated using the formula: $\text{Speed} = \text{Distance} / \text{Time}$. Define uniform circular motion. Uniform circular motion is the motion of an object moving in a circle at a constant speed, where the direction of the velocity vector is continuously changing.
