For example, they noted that certain materials changed color with temperature, leading to the development of simple thermoscopes (early temperature indicators).

The Invention of the Thermoscope

In the 16th century, scientists like Galileo Galilei invented the thermoscope, an instrument capable of demonstrating temperature differences. Unlike modern thermometers, thermoscopes lacked a scale and could not quantify temperature precisely but laid the groundwork for future innovations.

Development of the Thermometer

The transition from thermoscopes to thermometers involved the introduction of a scale and marked the beginning of quantitative temperature measurement. Key milestones include:

- **Galileo's Thermometer (1593):** Utilized air expansion to indicate temperature changes.
- **Daniel Gabriel Fahrenheit (1714):** Invented the mercury-in-glass thermometer with a standardized scale, the Fahrenheit scale.
