What Is Geometric Probability?

Defining Geometric Probability

Geometric probability is a branch of probability theory that deals with the likelihood of an event occurring within a geometric space. Instead of counting discrete outcomes, it involves calculating ratios of areas, lengths, or volumes.

For example:

- The probability that a randomly chosen point in a square lies within a certain circle inscribed inside it.
- The chance that a dart thrown randomly on a target hits a specific region.

Basic Concepts of Geometric Probability

Understanding geometric probability requires familiarity with several core concepts:

- Sample space: The entire geometric region where points are randomly selected.
- Event space: The specific region where the event of interest occurs.
- Area ratio: The probability that the event occurs is the ratio of the area of the event space to the total area of the sample space.

Mathematically, this is expressed as:

$$P(\text{event}) = \frac{\text{Area of event}}{\text{Total area of sample space}}$$

Example Problem from the Worksheet

Suppose there is a square with side length 10 units. Inside it, a circle of radius 5 units is inscribed. What is the probability that a randomly chosen point in the square lies inside the circle?

Solution:

- Total area of the square:

$$[10 \times 10 = 100 \text{ square units}]$$

- Area of the inscribed circle:

$$[\pi r^2 = \pi \times 5^2 = 25\pi \approx 78.54]$$

- Probability:

$$[P = \frac{\text{Area of circle}}{\text{Area of square}} = \frac{25\pi}{100} = \frac{\pi}{4} \approx 0.785]$$

- Interpretation: Approximately 78.5% chance that a randomly chosen point will fall inside the circle.

Solution:

$$X_L = 2\pi fL = 2\pi \cdot 60 \cdot 0.5 \approx 188.5\Omega$$

$$X_C = 1 / (2\pi fC) = 1 / (2\pi \cdot 60 \cdot 100e-6) \approx 26.5\Omega$$
