Understanding the Scope of Cost Accounting 401

Before diving into specific problems, it's crucial to understand what Cost Accounting 401 entails. This advanced course covers topics such as:

- Cost classification and analysis
- Cost allocation and apportionment
- Marginal costing and contribution analysis
- Standard costing and variance analysis
- Budgeting and control
- Activity-based costing
- Joint and by-product costing
- Cost control in complex manufacturing environments

Students often face intricate problems involving these topics, especially when integrating multiple concepts into real-world scenarios.

Common Problems in Advance Cost Accounting 401

Below are some typical problems encountered by students and professionals, along with their solutions.

1. Cost Allocation and Apportionment

Problem:

A manufacturing company has two departments: Production and Administration. The total overhead costs are \$120,000. The following data is available:

Department	Direct Labour Hours	Overheads to be allocated
------------	---------------------	---------------------------

-----	-----	-----
-------	-------	-------

Production	10,000	\$80,000
------------	--------	----------

Administration	2,000	\$40,000
----------------	-------	----------

Allocate the overheads to each department accurately using the appropriate basis.

Solution:

Since overheads are to be allocated based on direct labour hours:

- Total direct labour hours = 10,000 + 2,000 = 12,000 hours

- Overhead rate per labour hour = Total overheads / Total labour hours = \$120,000 / 12,000 = \$10 per hour

- Allocation:

- Production: 10,000 hours × \$10 = \$100,000

- Administration: 2,000 hours × \$10 = \$20,000

Note: The initial data suggests overheads are already categorized, but the problem emphasizes proper allocation based on the chosen basis.

2. Standard Costing and Variance Analysis

Problem:

A company sets the standard cost for 1 unit of product as follows:

- Direct materials: 2 kg @ \$5/kg = \$10
- Direct wages: 3 hours @ \$8/hour = \$24

During the period, the actual data are:

- Materials used: 2.2 kg per unit at \$5.50/kg
- Labour hours: 3.2 hours per unit at \$8.50/hour
- Actual units produced: 1,000 units

Calculate the materials and labour variances.

Solution:

Materials Variances:

- Material Price Variance (MPV):

$$= (\text{Actual Price} - \text{Standard Price}) \times \text{Actual Quantity}$$

$$= (\$5.50 - \$5.00) \times (2.2 \text{ kg} \times 1,000 \text{ units})$$

$$= \$0.50 \times 2,200 \text{ kg} = \$1,100 \text{ Unfavorable}$$

- Material Usage Variance (MUV):

$$= (\text{Actual Quantity} - \text{Standard Quantity}) \times \text{Standard Price}$$

$$= (2.2 \text{ kg} - 2 \text{ kg}) \times \$5 \times 1,000 \text{ units}$$

$$= 0.2 \text{ kg} \times \$5 \times 1,000 = \$1,000 \text{ Unfavorable}$$

Labour Variances:

- Wage Rate Variance (WRV):

$$= (\text{Actual Rate} - \text{Standard Rate}) \times \text{Actual Hours}$$

$$= (\$8.50 - \$8) \times (3.2 \text{ hours} \times 1,000 \text{ units})$$

$$= \$0.50 \times 3,200 \text{ hours} = \$1,600 \text{ Unfavorable}$$

- Labour Efficiency Variance (LEV):

$$= (\text{Actual Hours} - \text{Standard Hours}) \times \text{Standard Rate}$$

$$= (3.2 \text{ hours} - 3 \text{ hours}) \times \$8 \times 1,000 \text{ units}$$

$$= 0.2 \text{ hours} \times \$8 \times 1,000 = \$1,600 \text{ Unfavorable}$$

3. Marginal Costing and Break-even Analysis

Problem:

A firm produces a product with the following data:

- Selling Price per unit: \$50
- Variable Cost per unit: \$30
- Fixed Costs: \$100,000

Calculate the break-even point in units and sales value.

Solution:

- Contribution per unit:

$$= \text{Selling Price} - \text{Variable Cost} = \$50 - \$30 = \$20$$

- Break-even point (units):

$$= \text{Fixed Costs} / \text{Contribution per unit} = \$100,000 / \$20 = 5,000 \text{ units}$$

- Break-even sales value:

$$= \text{Break-even units} \times \text{Selling price} = 5,000 \times \$50 = \$250,000$$

This analysis helps managers understand the sales volume needed to cover all costs.

4. Activity-Based Costing (ABC) Problems

Problem:

A company allocates overheads using ABC. The following data is available:

Cost Pool	Total Overheads	Cost Drivers	Total Driver Units
Machine setups	\$60,000	Number of setups	300
Quality inspections	\$40,000	Number of inspections	200

Products:

Product	Number of setups	Number of inspections	Units produced
A	150	80	1,000
B	150	120	2,000

Calculate the overhead cost per unit for each product.

Solution:

- Setup cost per setup:

$$= \$60,000 / 300 = \$200 \text{ per setup}$$

- Inspection cost per inspection:

$$= \$40,000 / 200 = \$200 \text{ per inspection}$$

- Total overhead allocated to each product:

- Product A:

Overhead from setups: $150 \text{ setups} \times \$200 = \$30,000$

Overhead from inspections: $80 \text{ inspections} \times \$200 = \$16,000$

Total overhead: \$46,000

- Product B:

Overhead from setups: $150 \text{ setups} \times \$200 = \$30,000$

Overhead from inspections: $120 \text{ inspections} \times \$200 = \$24,000$

Total overhead: \$54,000

- Overhead per unit:

- Product A:

$= \$46,000 / 1,000 \text{ units} = \46 per unit

- Product B:

$= \$54,000 / 2,000 \text{ units} = \27 per unit

This detailed allocation helps in accurate product costing and pricing decisions.

Problem 2: Voltage Divider

Determine the output voltage across R_2 in a voltage divider circuit with $V_{in}=12V$, $R_1=1k\Omega$, $R_2=2k\Omega$.

Solution:

$$V_{out} = V_{in} R_2 / (R_1 + R_2) = 12V \cdot 2000\Omega / (1000\Omega + 2000\Omega) = 12V \cdot 2000 / 3000 = 8V$$

Problem 3: AC Circuit Analysis

Find the impedance of an inductor $L=0.5H$ and capacitor $C=100\mu F$ at 60Hz.

Solution:

$$X_L = 2\pi fL = 2\pi \cdot 60 \cdot 0.5 = 188.5\Omega$$

$$X_C = 1 / (2\pi fC) = 1 / (2\pi \cdot 60 \cdot 100e-6) = 26.5\Omega$$

$$\text{Impedance } Z = \sqrt{X_L^2 + X_C^2} = \sqrt{(188.5^2 + 26.5^2)} = 190.3\Omega$$
