Common Questions and Their Answer Keys

Below are typical questions from Chapter 21, accompanied by detailed answer keys to help you

verify your understanding.

Question 1: What is the First Law of Thermodynamics?

Answer: The First Law of Thermodynamics states that energy cannot be created or destroyed in an isolated system. It is often expressed as:

$$\Delta U = Q - W$$

where:

- ΔU is the change in internal energy of the system,
- Q is the heat added to the system,
- W is the work done by the system.

This law emphasizes the conservation of energy during thermal processes.

Question 2: Describe the difference between transverse and longitudinal waves.

Answer:

- **Transverse Waves:** The particle displacement is perpendicular to the direction of wave propagation. Examples include waves on a string or surface water waves.
- **Longitudinal Waves:** The particle displacement is parallel to the direction of wave propagation. Sound waves in air are a common example.

Question 3: How is electrical resistance affected by temperature?

Answer:

- For most conductors, resistance increases as temperature increases due to increased atomic vibrations that impede electron flow.
- In some materials like superconductors, resistance drops to zero below a critical temperature.

Question 4: What is the significance of the wave frequency?

Answer: The frequency of a wave determines its energy and color (in the case of light). It is inversely related to wavelength as per the wave equation:

$$c = \lambda f$$

where c is the wave speed, λ is wavelength, and f is frequency.

Question 5: Explain the concept of electrical current.

Answer: Electrical current is the flow of electric charge through a conductor, typically measured in amperes (A). It results from the movement of electrons and is driven by a voltage difference across the circuit.
