Sample Merriam Dynamics Kinematics Problems with Solutions

Problem 1: Velocity of a Point in a Slider-Crank Mechanism

Given a slider-crank mechanism where the crank (AB) rotates at 300 rpm, with length $(AB = 0.15\text{ m})$, and the connecting rod (BC) has length (0.5 m) . Find the velocity of the slider (C) when the crank makes a 60° angle with the horizontal.

Solution:

- **Identify knowns:** $\omega_{AB} = 300\text{ rpm} = \frac{300 \times 2\pi}{60} \approx 31.42\text{ rad/sec}$; $\theta = 60^\circ$; $(AB = 0.15\text{ m})$; $(BC = 0.5\text{ m})$.
- **Convert rpm to rad/sec:** $\omega_{AB} = 31.42\text{ rad/sec}$.
- **Determine the velocity of point B:** $\vec{v}_B = \vec{\omega}_{AB} \times \vec{r}_{AB}$.
-

Calculate $\vec{v}_B$:

\[

$$v_B = \omega_{AB} \times AB = 31.42 \text{ rad/sec} \times 0.15 \text{ m} \approx 4.71 \text{ m/sec}$$

\]

Direction: perpendicular to (AB) , following the right-hand rule.

- **Use relative velocity equation:** $(v_C = v_B + v_{C/B})$, but since (C) is on the connecting rod (BC) , and assuming the mechanism is planar and rigid, apply the velocity polygon or complex vector method to find (v_C) .

-

Apply geometric approach:

- Construct the velocity triangle at point B, considering the known velocity magnitude and direction.

- Use the law of sines or cosines to resolve the components.

- **Result:** The slider (C) moves with a velocity approximately (4.71 m/sec) in the horizontal direction when the crank is at 60° .

Problem 2: Accelerations in a Four-Bar Linkage

In a four-bar linkage, the crank (AB) rotates at 150 rpm counterclockwise, with length $(AB = 0.2 \text{ m})$. The coupler (BC) has length (0.5 m) , and the fixed link (AD) is 0.4 m. Find the acceleration of the coupler point (C) when $(\angle ABC = 45^\circ)$.

Solution:

- **Convert rotational speed:** $(\omega_{AB} = \frac{150 \times 2\pi}{60} = 15.7 \text{ rad/sec})$.

- **Determine the velocity of (B) :**

\[

$$v_B = \omega_{AB} \times AB = 15.7 \times 0.2 = 3.14 \text{ m/sec}$$

\]

- **Apply velocity analysis:**

- Use the velocity polygon to find the direction of (v_B) .
- Resolve to find velocity components of point (C) .
- Use geometric relations to find the velocity of (C) .
- **Calculate acceleration:**
 - Determine the angular acceleration (α_{AB}) if necessary (assumed zero if steady speed).
 - Use the acceleration equation:

$$[$$

$$\vec{a}_C = \vec{\alpha}_{AB} \times \vec{r}_{AC} + \vec{\omega}_{AB} \times (\vec{\omega}_{AB} \times \vec{r}_{AC}) + \text{relative acceleration terms}$$

$$]$$

- Since (α_{AB}) is not given, assume zero for simplicity, then:

$$[$$

$$a_C = \omega_{AB}^2 \times r_{AC}$$

$$]$$

- **Final result:**

$$[$$

$$a_C = (15.7)^2 \times 0.5 \approx 123.45 \text{ m/sec}^2$$

$$]$$

In the realm of mechanical engineering and physics, understanding the motion of bodies without considering the forces that cause them is fundamental. This branch of study, known as kinematics, allows engineers and students to analyze how objects move?describing position, velocity, acceleration, and the relationships between them. Among the various educational resources available, Merriam dynamics kinematics problems with solutions have gained recognition for their clarity, depth, and practical relevance. These problems serve as invaluable tools for mastering the core concepts and applying theoretical knowledge to real-world scenarios. This article delves into

the intricacies of Merriam's approach to kinematics problems, providing detailed solutions and insights to enhance your understanding.

Understanding Merriam Dynamics in Kinematics

What Is Merriam's Approach?

Merriam's method refers to a structured approach to solving dynamics and kinematics problems, emphasizing clarity, systematic analysis, and logical reasoning. It often involves:

- Clearly defining the problem parameters
- Drawing accurate free-body or displacement diagrams
- Applying fundamental kinematic equations
- Using vector analysis for complex motions
- Validating solutions through units and physical plausibility

This approach is especially beneficial in educational settings, where students grapple with abstract concepts and complex diagrams. Merriam's problems typically incorporate real-world mechanisms?like linkages, gears, or slider-crank mechanisms?that challenge students to apply multiple concepts simultaneously.

Core Concepts in Merriam Kinematics Problems

- Types of Motion

Merriam problems often involve various types of motion, including:

- Translational motion: Movement along a straight line
- Rotational motion: Movement about an axis
- Combined motion: A combination of translation and rotation, such as in linkages or gears

- Kinematic Equations

Fundamental equations used include:

- $v = v_0 + a t$ (velocity-time relation)

- $(s = s_0 + v_0 t + \frac{1}{2} a t^2)$ (displacement-time relation)
- For rotational motion: $(\omega = \omega_0 + \alpha t)$, $(\theta = \theta_0 + \omega_0 t + \frac{1}{2} \alpha t^2)$

- Relative Velocity and Acceleration

Understanding how different parts of a mechanism move relative to each other is critical. The key principles include:

- Velocity of a point on a rotating body: $(v = r \omega)$
- Relative velocity equations: $(v_{AB} = v_A + v_{B/A})$

- Instantaneous Centers of Rotation

Merriam problems often incorporate the concept of instantaneous centers, simplifying complex planar motions by treating them as pure rotation about a specific point at a given instant.

Typical Merriam Kinematics Problems with Solutions

Problem 1: Slider-Crank Mechanism ? Calculating the Velocity of the Slider

Problem Statement:

A slider-crank mechanism consists of a crank rotating at 300 rpm with a length of 0.2 m. The connecting rod length is 0.5 m. Determine the velocity of the slider when the crank makes a 60° angle with the horizontal.

Solution Approach:

- Identify Known Data:
- $(\omega_{\text{crank}} = 300 \text{ rpm} = \frac{300 \times 2\pi}{60} = 10\pi \text{ rad/sec})$
- Crank length $(r = 0.2 \text{ m})$
- Connecting rod length $(L = 0.5 \text{ m})$
- Crank angle $(\theta = 60^\circ)$

- Convert ω to rad/sec:

$$\omega = 10\pi \approx 31.416 \text{ rad/sec}$$

- Determine the velocity of the crank's end:

$$v_{\text{crank}} = r \omega \sin \theta$$

$$v_{\text{crank}} = 0.2 \times 31.416 \times \sin 60^\circ$$

$$v_{\text{crank}} = 0.2 \times 31.416 \times 0.866 \approx 5.44 \text{ m/sec}$$

- Apply the velocity relation for the slider:

Using the loop-closure equation and relative motion analysis, the slider velocity v_s can be calculated via the velocity triangle or using the velocity method:

[

$$v_s = v_{\text{crank}} \cos \theta + \text{additional components}$$

]

But more straightforwardly, the velocity of the slider (assuming a proper configuration) is:

[

$$v_s = r \omega \cos \theta$$

]

$$v_s = 0.2 \times 31.416 \times \cos 60^\circ = 0.2 \times 31.416 \times 0.5 \approx 3.14 \text{ m/sec}$$

Final Answer:

The velocity of the slider at the given instant is approximately 3.14 m/sec.

Problem 2: Determining Angular Acceleration in a Linkage

Problem Statement:

A four-bar linkage operates with a fixed link of 0.4 m rotating at 120 rpm. The coupler link of length 0.3 m makes a 45° angle at a certain instant. Find the angular acceleration of the coupler if the crank's angular acceleration is 50 rad/sec^2 .

Solution Approach:

- Convert known data:

- $(\omega_{\text{fixed}} = 120 \text{ rpm} = 4\pi \text{ rad/sec})$
- $(\alpha_{\text{crank}} = 50 \text{ rad/sec}^2)$
- Link lengths: $(r = 0.4 \text{ m}), (l = 0.3 \text{ m})$
- Angle $(\theta = 45^\circ)$

- Apply the velocity and acceleration loop equations:

The linkage's velocity analysis yields the angular velocity of the coupler. Subsequently, the acceleration analysis involves differentiating the velocity equations to find angular acceleration.

- Velocity analysis:

Use the loop equation:

$$[$$

$$r \omega_{\text{crank}} + l \omega_{\text{coupler}} = \text{constant}$$

$$]$$

Solve for $(\omega_{\text{coupler}})$.

- Acceleration analysis:

Using the acceleration loop:

$$\lceil$$

$$r \alpha_{\text{crank}} + l \alpha_{\text{coupler}} = -r \omega_{\text{crank}}^2 \sin \theta - l \omega_{\text{coupler}}^2 \sin \phi$$

$$\rfloor$$

Where ϕ is the angle of the coupler link.

- Calculate α_{coupler} :

Substitute known values and solve for the angular acceleration.

Final Result:

This calculation involves detailed vector analysis, but after solving, the angular acceleration of the coupler is approximately $X \text{ rad/sec}^2$ (exact value depends on the precise angles and solving the equations).

Advanced Topics in Merriam Kinematics Problems

Instantaneous Center of Rotation (ICR)

A powerful concept in Merriam problems is the ICR, which simplifies complex planar motions. For a point in a mechanism:

- The ICR is the point about which the body appears to rotate instantaneously.
- To find the ICR, draw velocity vectors and locate their intersection.

Application:

In a four-bar linkage, the ICRs can be found for each link at a given instant, simplifying velocity and acceleration calculations.

Relative Velocity and Acceleration

Understanding how different parts of a mechanism relate is crucial:

- Relative velocity: $\vec{v}_{B/C} = \vec{v}_B - \vec{v}_C$
- Relative acceleration: $\vec{a}_{B/C} = \vec{a}_B - \vec{a}_C$

These concepts help analyze complex linkages and slider mechanisms.

Practical Considerations

- Precise diagramming is essential.
- Units must be consistent.
- Physical plausibility checks prevent calculation errors.

Tips for Solving Merriam Kinematics Problems Effectively

- Draw Clear Diagrams: Always depict the mechanism at the instant of interest, labeling all knowns and unknowns.
- Use Appropriate Coordinates: Choose a coordinate system aligned with the mechanism's geometry.
- Apply Conservation Principles: Leverage the loop-closure equations for velocity and acceleration.
- Check Units and Magnitudes: Ensure calculations make physical sense.
