Understanding Sepam Motor Protection Relays

What is a Sepam Relay?

Sepam relays are high-performance protection devices manufactured by Schneider Electric. They are designed to monitor electrical parameters and protect motors and other equipment against faults such as overloads, short circuits, phase failures, and under/over voltages.

Key features include:

- Advanced protection algorithms
- User-friendly interface
- Communication capabilities for remote monitoring
- Flexible setting options for various protection functions

Types of Protection Functions in Sepam Relays

Sepam relays typically support multiple protection functions:

- Overcurrent and short-circuit protection
- Under/over voltage protection
- Phase failure and phase sequence protection
- Thermal overload protection

- Motor starting and running protection
- Earth fault detection

Understanding these functions is essential before proceeding with relay settings.

Step-by-Step Guide to Setting a Sepam Motor Protection Relay

1. Gather Necessary Data

Before configuring the relay, collect vital information about the motor and electrical system:

- Motor rated voltage (V_{rated})
- Motor rated current (I_{rated})
- Motor rated power (kW or HP)
- System voltage and frequency
- Short circuit withstand level (fault current)
- Protection coordination requirements

2. Define Protection Settings

Based on the system data, determine the appropriate settings for each protection function. The main settings include:

- Overcurrent pickup current (I_{pickup})
- Time delay settings
- Earth fault threshold
- Voltage thresholds
- Thermal overload parameters

Example Configuration of Sepam Relay for Motor Protection

To illustrate a practical example, consider a 250 kW, 400 V, 50 Hz motor with the following specifications:

- Rated current: 370 A
- Short circuit current at the point of installation: 3000 A
- Desired protection coordination: select settings to trip before damage occurs during faults, but avoid nuisance trips

Below are detailed steps and example settings.

3. Set Overcurrent Protection

- Pickup Current (Ipickup): Typically set to 115-125% of Irated to ensure the relay trips during overloads but not during normal starting currents.

Example:

- $I_{pickup} = 1.25 \times 370\text{ A} = 463\text{ A}$

- Time Delay (tdelay): Set to coordinate with upstream and downstream devices, often in the range of 0.2 - 1 second.

Example:

- $t_{delay} = 0.5\text{ seconds}$

Setting:

plaintext

Overcurrent pickup = 463 A

Time delay = 0.5 seconds

...

4. Configure Short-Circuit Protection

- High-Set Overcurrent: For instantaneous short-circuit detection, set at a higher current threshold, e.g., 200% of Irated.

Example:

- Instantaneous pickup = $2 \times 370 \text{ A} = 740 \text{ A}$

- Protection Coordination: Ensure the instantaneous setting is below the breaker trip point but above the overload setting.

5. Earth Fault Protection Settings

- Earth Fault Threshold: Usually set at 20-50% of phase current, depending on system grounding.

Example:

- Earth fault pickup = $0.3 \times I_{rated} = 111 \text{ A}$

- Time Delay: Slightly longer than phase overcurrent to prevent nuisance trips.

Example:

- $t_{delay} = 1 \text{ second}$

6. Voltage Protection Settings

- Under Voltage (UV): Set at 85-90% of nominal voltage to disconnect the motor during voltage dips.

Example:

- UV threshold = $0.85 \times 400 \text{ V} = 340 \text{ V}$

- Over Voltage (OV): Set at 110-115% of nominal voltage.

Example:

- OV threshold = $1.10 \times 400 \text{ V} = 440 \text{ V}$

7. Thermal Overload Protection

- Configuration: Use motor thermal models or temperature sensors to prevent overheating.
- Settings: Based on motor thermal characteristics, typically set to trip if the motor exceeds safe temperature limits.

Additional Considerations for Reliable Protection

1. Protection Coordination

- Ensure that relay settings are coordinated with upstream circuit breakers and downstream devices.
- Use time-current characteristic curves to prevent unnecessary trips and ensure selectivity.

2. Testing and Validation

- Perform primary and secondary injection testing to verify relay operation.
- Simulate faults to confirm correct trip times and thresholds.

3. Documentation and Record Keeping

- Document all settings, test results, and system configurations.
- Maintain logs for future troubleshooting and audits.

4. Regular Maintenance

- Periodically review and adjust settings as system parameters change.
- Conduct routine testing to ensure relay accuracy.

Conclusion

Proper configuration of the Sepam motor protection relay is vital for safeguarding motors against

electrical faults and operational issues. The example provided demonstrates how to set the relay parameters based on motor ratings and system characteristics, ensuring effective protection coordination. By understanding the key protection functions, carefully selecting setpoints, and verifying proper operation through testing, engineers can optimize motor protection, minimize downtime, and extend equipment lifespan.

Remember, every motor and system has unique requirements. Always tailor relay settings accordingly, adhere to relevant standards, and consult manufacturer guidelines for detailed instructions. Understanding the Sepam Motor Protection Relay

Before delving into specific settings, it is essential to understand the fundamental features of the Sepam relay and the protection functions it offers.

What is a Sepam Relay?

Sepam (System Protection and Automation Module) is a digital relay series designed to provide comprehensive protection, control, and monitoring of electrical power systems. The relays incorporate multiple protection functions such as overcurrent, earth fault, thermal overload, and differential protection, all configurable via user-friendly software interfaces.

Key Features Relevant to Motor Protection

- Protection Functions: Overcurrent, short-circuit, motor thermal protection, locked rotor, phase failure, and under-voltage.
- Communication Capabilities: Modbus, IEC 61850, and other protocols for remote monitoring.
- Configurability: Customizable settings for each protection element, enabling tailored protection schemes.
- Event Logging & Diagnostics: Facilitates troubleshooting and preventive maintenance.

Fundamental Principles of Motor Protection Settings

Motor protection involves safeguarding against abnormal conditions that can cause damage or reduce the lifespan of the motor. Proper settings are critical to distinguish between normal operational transients and genuine faults.

Types of Faults Addressed

- Overcurrent and Short-Circuit: Excessive current flow damaging the motor windings.
- Thermal Overload: Excess heat buildup due to prolonged overcurrent conditions.
- Phase Failures or Imbalance: Conditions that may cause torque reduction or mechanical stress.
- Locked Rotor: Condition where the rotor cannot turn, leading to excessive current.

Key Parameters to Configure

- Pickup current (I_e): Threshold at which protection activates.
- Time delay (T_e): Ensures transient conditions don't cause unnecessary trips.
- Curve characteristics: Defines how the relay responds over different current levels.
- Protection zones and thresholds: For differential or directional protection.

Step-by-Step Sepam Motor Protection Relay Setting Example

This section provides a structured approach to configuring a Sepam relay for a typical industrial motor, assuming a motor rated at 150 kW, 400 V, 50 Hz, with typical protection requirements.

- Gather Motor Data and System Parameters
 - Rated Power: 150 kW
 - Rated Voltage: 400 V
 - Rated Current (I_n): Approximately 380 A (calculated)

- Service Factor: 1.0 (standard)
 - Type of Load: Inductive motor
 - Protection Requirements: Overcurrent, thermal overload, phase failure, and locked rotor
-
- Calculate Protection Settings

Overcurrent Setting (Pickup Current)

- Standard practice suggests setting the relay at 120%-150% of the motor's full load current (I_n) for overload protection.
- For 380 A rated current:

$$I_{le} = 1.25 I_n = 1.25 \times 380 \text{ A} \approx 475 \text{ A}$$

- Choose a pickup setting:

$$I_{le} = 1.3 I_n \approx 494 \text{ A}$$

- Setting range:

$$I_{le} = 470 \text{ A to } 500 \text{ A} \text{ (adjustable based on manufacturer recommendations)}$$

Time Delay (T_e)

- To prevent nuisance tripping during transient conditions, select a time delay:

$$T_e = 3 \text{ to } 5 \text{ seconds for thermal overload protection}$$

Short-Circuit Protection

- Fast acting, with a lower pickup current (e.g., 200% of I_n):

$$I_{le} = 2.0 I_n \approx 760 \text{ A}$$

- Use an instantaneous or very short delay (e.g., 0.1 s)

Thermal Overload Protection

- Use the thermal model embedded in the relay, typically based on motor full load current and duty cycle.

Phase Failure and Unbalance Protection

- Set phase failure detection at a threshold (e.g., 80% of rated voltage per phase)

- Accessing the Sepam Configuration Software

- Connect the relay via Ethernet or serial port.
- Launch the Sepam Protection Suite software.
- Load the default configuration for the motor protection application.
- Navigate to protection functions: Overcurrent, thermal, phase failure, etc.

- Configuring Overcurrent Protection

- Enable the Overcurrent function.
- Input the calculated pickup current (e.g., 470 A).
- Set the time delay (e.g., 4 seconds).
- Select the appropriate characteristic curve:
 - Inverse Definite Minimum Time (IDMT)
 - Definite Time

- Configuring Thermal Protection

- Use the Thermal Model:
 - Input motor rated current.
 - Set the thermal time constant as per motor specifications.
 - Ensure the relay's thermal protection correlates with motor thermal limits.

- Configuring Phase Failure and Unbalance Detection
 - Enable phase failure detection.
 - Set threshold voltage (e.g., 80% of line-to-line voltage).
 - Enable phase unbalance detection if needed.
- Finalizing and Validating Settings
 - Save the configuration.
 - Perform simulation or testing with current injection to verify protection operation.
 - Adjust settings based on test results and system behavior.

Best Practices and Considerations in Relay Settings

Coordination with System Protection

- Ensure settings are coordinated with upstream circuit breakers and downstream protection devices.
- Conduct time-current coordination studies to prevent nuisance trips or damage.

Consideration of Transients and Start-up Conditions

- During starting, currents can reach 6-8 times I_n .
- Settings should allow for motor startup without tripping, but still protect against faults.

Regular Testing and Maintenance

- Periodically verify relay functionality with secondary injection testing.
- Update settings if motor load conditions or system configurations change.

Documentation and Record-Keeping

- Maintain detailed records of all settings.
- Record calibration and testing results for future reference.

Conclusion

Properly configuring a Sepam motor protection relay is a meticulous process that requires a clear understanding of motor characteristics, system conditions, and protection principles. The example outlined above demonstrates a systematic approach to setting up the relay, balancing sensitivity with selectivity to ensure reliable protection without unnecessary interruptions. As with any protective device, ongoing testing, maintenance, and adjustment are essential to adapt to evolving operational conditions and to uphold system integrity.
